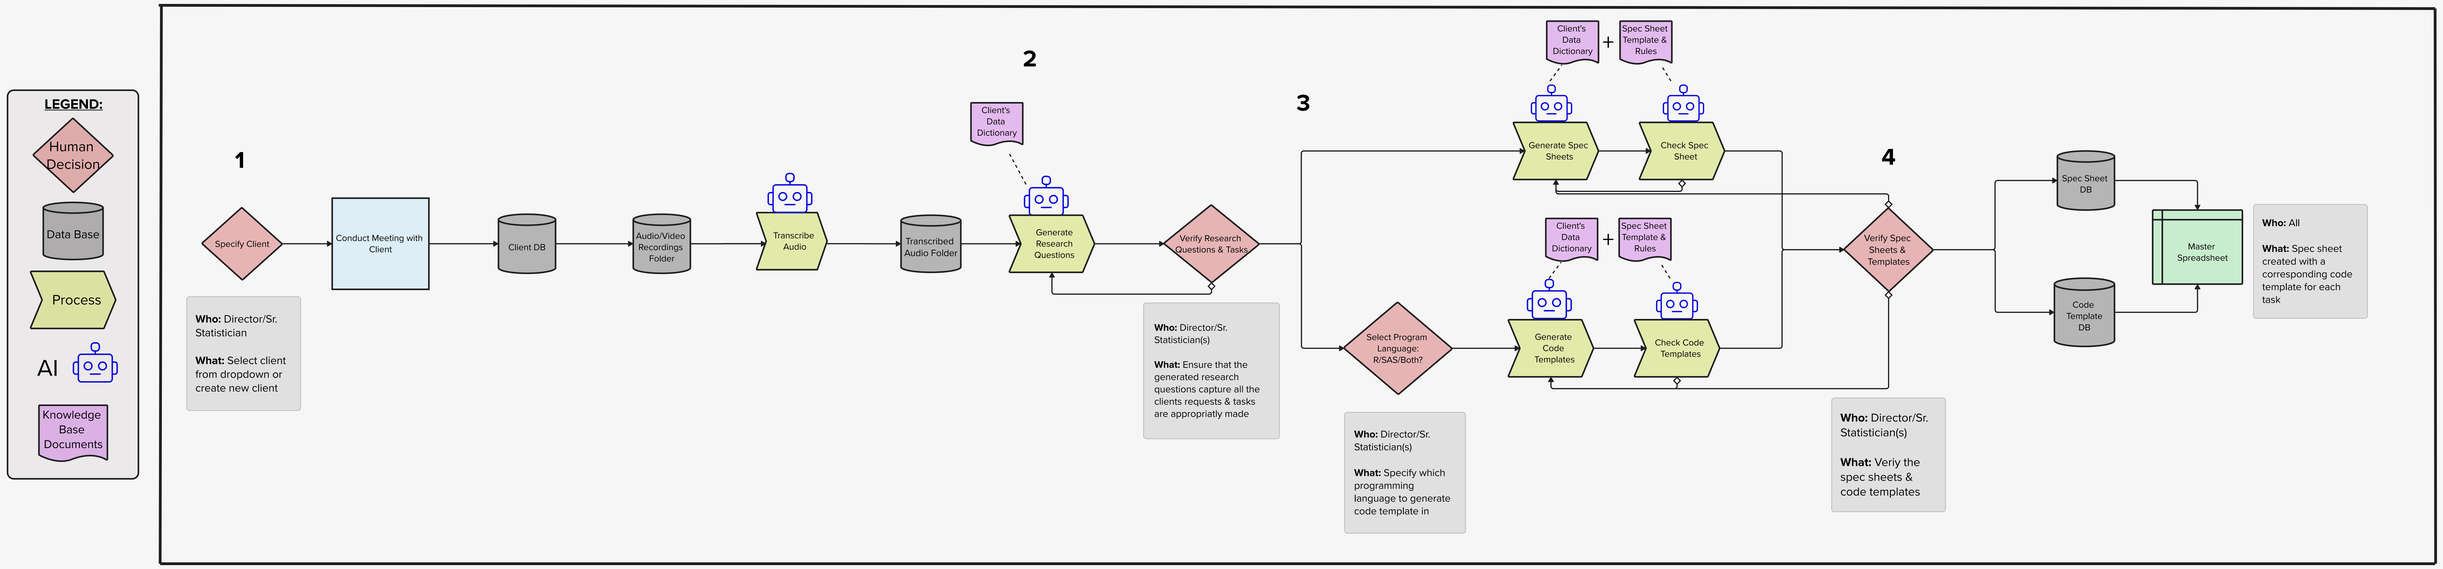
Spec Sheet & Code Template Generator

Author: Tanner Rapp



Purpose:

• Creates spec sheets and code templates for each client task/request.

• Directors and senior statisticians can review everything early before tasks reach production or validation teams.

• AI only drafts and verifies documents based on given guidlines — it never runs or executes any generated code.

• Code templates are purely guides tailored to each task to keep production and validation programs clean and consistent.

• All generated spec sheets and templates feed into a master spreadsheet, where they can be updated or edited later without breaking the workflow.

General Outline:

1.) You start by selecting the client in the interface, then recording your meeting as you normally would. Once the audio or video file is saved, the AI picks it up, transcribes it, and drops the transcript into the project's folder.

2.) Using the client's data dictionary, the system then drafts research questions based on what came up in the meeting. It walks you through reviewing, editing, and approving those questions so everything aligns with the client's needs.

3.) After the questions are finalized, the tool uses them to generate spec sheets and code templates automatically. You review each one, make any adjustments you want, and confirm they're ready to go.

4.) The flow wraps up by saving the approved spec sheets and code templates into their databases and updating the master spreadsheet so every task is tracked and easy to follow.

Maintenance Load:

Someone has to:

• update the templates

• write a data dictionary for each client's dataset

Main Concerns:

• Would this fit into existing SOPs?

• Is this idea worth it?

• Audit trails?

• Client confidentiality?
